Project Overview

This project focuses on building a **Decentralized Dataspace** using **FIWARE and Eclipse Dataspace Components (EDC)**. The goal is to enable organizations to **securely share data while maintaining control and sovereignty**.

Key idea:

- No central system → decentralized data exchange
- Data sharing controlled by **contracts, policies, and identity (VC/DID)**

Project phases:

- **Phase 1:** Setup infrastructure (completed)
- **Phase 2A:** FIWARE validation
- **Phase 2B:** EDC implementation
- **Phase 3:** Finalization & demo

Project Goal

Build a **secure, policy-driven dataspace** where participants can exchange data safely without losing control.

Weekly Work Schedule

Mandatory Presence (from stakeholder email + plan)

- **Monday → FULL DAY (09:00 – 16:00)**
 - Sprint work
 - Development
 - Collaboration
- **Thursday → AFTERNOON (13:00 – 16:00)**
 - Progress updates
 - Meetings with supervisors
 - Documentation

Documentation Maintenance & Ownership

This Reading Guide serves as the central navigation and reference point for all project deliverables, reports, presentations, repositories, and supporting materials.

To ensure consistency, traceability, and accessibility throughout the project, the following documentation maintenance rules apply:

Individual Responsibility

Each team member is responsible for maintaining the documentation related to their own contributions. When creating, modifying, or submitting project artifacts, the responsible contributor must ensure that all relevant references are updated accordingly.

Required Updates

When a new artifact is created or an existing artifact is modified, the responsible contributor must:

- Add the artifact to the appropriate section of this Reading Guide.
- Update references in Microsoft Teams, GitHub, GitLab, and shared storage locations where applicable.
- Ensure links remain functional and accessible to all team members and stakeholders.
- Update document version information where version tracking is available.
- Verify that superseded versions are archived or clearly marked.

Version Management

All major document revisions should be recorded within the document's version history section, including:

- Version number
- Date
- Author
- Summary of changes

This ensures transparency and traceability throughout the project lifecycle.

Repository and Storage Consistency

To prevent information fragmentation, project resources should remain synchronized across approved platforms, including:

- Microsoft Teams
- Shared Drive Storage
- GitHub
- GitLab
- Project Documentation

Any newly added files, repositories, presentations, reports, or supporting materials must be reflected in the relevant locations where project information is maintained.

Quality Assurance

Before project milestones, demonstrations, and final submissions, team members should verify that:

- Documentation is up-to-date.
- References and hyperlinks are functional.
- Deliverables are listed in the appropriate sections.
- Version information is accurate.
- Required supporting materials are accessible.

The Reading Guide should always reflect the current state of the project and act as the authoritative index of project documentation.
